

# Lance Jet III/ Chorro Lanza III

These fountain nozzles are similar to the two previous models in terms of their operating principle. Its manufacture uses **more economical** materials and manufacturing techniques than the previous two series. In this model, the brass body is replaced by an AISI 304 stainless steel casing. Because the previous series have a smaller deflection cone at great heights, they perform better; however, for the first three quarters of the water jet height, they both provide similar quality. They are supplied with an outer swivel joint or with no joint.

Estas toberas son similares a las dos series anteriores en cuanto a principio de funcionamiento. Para su fabricación usamos materiales y técnicas de fabricación **más económicas** que la anterior. Se sustituye el cuerpo principal de latón por acero inoxidable AISI 304. Al llevar un cono deflector menor a grandes alturas el comportamiento de la serie anterior es mejor, pero en los tres primeros cuartos del chorro de agua ambas calidades son similares. Se comercializan con rótula externa o sin rótula.
